On the second regularized trace formula for a differential operator with unbounded coefficients

Erdal Gül

(Yildiz Technical University, Mathematics Department, Istanbul, Turkey)

E-mail: gul@yildiz.edu.tr

Let H be an infinite dimensional separable Hilbert space. Let denote the inner product and the norm in H by (\cdot, \cdot) and $\|\cdot\|$, respectively and denote the set of all kernel operators from H to H by $\sigma_1(H)$. Let $H_1 = L_2([0, \pi]; H)$ be the set of all strongly measurable functions f defined on $[0, \pi]$ with their values in H such that for every $g \in H$ the scalar function $(f(x), g)$ is measurable in the interval $[0, \pi]$ and

$$\int_0^\pi \|f(x)\|^2 dx < \infty.$$

In $H_1 = L_2([0, \pi]; H)$ we consider the operators

$$L = L_0 + Q, \quad L_0 = y'' + Ay$$

with the same boundary conditions $y'(0) = y'(\pi) = y'''(0) = y'''(\pi) = 0$. Here the operator $A : D(A) \rightarrow H$ is a densely defined on H such that $A = A^* \geq I$, $A^{-1} \in \sigma_\infty(H)$ where I is identity operator on H , A^* is the adjoint operator of A and $\sigma_\infty(H)$ is the set of all compact operators from H to H . And, $Q(x)$ is an operator function satisfying the following conditions:

- (a) $Q(x) : H \rightarrow H$ is a self-adjoint operator for every $x \in [0, \pi]$.
- (b) $Q(x)$ is weakly measurable in the interval $[0, \pi]$ and for every $f, g \in H$, the scalar function $(Q(x)f, g)$ is measurable on $[0, \pi]$.
- (c) The function $\|Q(x)\|$ is bounded on $[0, \pi]$.

Let $\gamma_1 \leq \gamma_2 \leq \dots \leq \gamma_n \leq \dots$ be the eigenvalues of the operator A and $\varphi_1, \varphi_2, \dots, \varphi_n, \dots$ be the orthonormal eigenvectors corresponding to these eigenvalues. Here, each eigenvalue is represented as many times as its multiplicity. Moreover, let the eigenvalues of the operator L_0 and L be $\mu_1 \leq \mu_2 \leq \dots \leq \mu_n \leq \dots$ and $\lambda_1 \leq \lambda_2 \leq \dots \leq \lambda_n \leq \dots$, respectively.

Lemma 1. *If $\gamma_j \sim a \cdot j^\alpha$ ($a > 0, \alpha < \infty$) as $j \rightarrow \infty$ then the asymptotic formula*

$$\lambda_n, \mu_n \sim dn^{\frac{4\alpha}{4+\alpha}} \text{ as } n \rightarrow \infty \quad (1)$$

holds where d is a constant.

Let $R_\lambda^0 = (L_0 - \lambda I)^{-1}$, $R_\lambda = (L - \lambda I)^{-1}$ be the resolvents of the operators L_0 and L , respectively. By the well known equality

$$R_\lambda = R_\lambda^0 - R_\lambda Q R_\lambda^0 \quad (\lambda \in \rho(L) \cap \rho(L_0))$$

we have:

Lemma 2.

$$\sum_{q=1}^{n_p} (\lambda_q^2 - \mu_q^2) = \sum_{j=1}^s M_{pj} + M_p^{(s)}$$

where

$$M_{pj} = \frac{(-1)^j}{\pi i j} \int_{|\lambda|=b_p} \lambda \operatorname{tr}[(Q R_\lambda^0)^j] d\lambda \quad (j = 1, 2, \dots) \quad (2)$$

$$M_p^{(s)} = \frac{(-1)^s}{2\pi i} \int_{|\lambda|=b_p} \lambda^2 \text{tr}[R_\lambda(QR_\lambda^0)^{s+1}] d\lambda. \quad (3)$$

Theorem 3. *If the operator function $Q(x)$ satisfies the conditions (a), (b), (c) and $\gamma_j \sim aj^\alpha$ ($a > 0, \alpha > \frac{8}{7}(3 + \sqrt{2})$) as $j \rightarrow \infty$ then ,*

$$\lim_{p \rightarrow \infty} M_{pj} = 0 \quad (j = 2, 3, 4, \dots).$$

Theorem 4. *If the operator function $Q(x)$ satisfies the following conditions*

- i) $Q(x)$ has weak derative of the 8-th order in the interval $[0, \pi]$ and the function $(Q^{(8)}(x)u, v)$ is continuos for every $u, v \in H$.
- ii) For every $x \in [0, \pi]$, $Q^{(i)}(x) : H \rightarrow H$ ($i = 0, 1, \dots, 8$) are self-adjoint operators.
- iii) For every $x \in [0, \pi]$, $Q^{(8)}(x)$, $AQ^{(2i)}(x) \in \sigma_1(H)$ ($i = 0, 1, \dots, 8$) and the functions $\|Q^{(8)}(x)\|_{\sigma_1(H)}$, $\|AQ^{(2i)}(x)\|_{\sigma_1(H)}$ ($i = 0, 1, \dots, 8$) are bounded and measurable in the interval $[0, \pi]$.

and if $\gamma_j \sim aj^\alpha$ ($a > 0, \alpha > \frac{8}{7}(3 + \sqrt{2})$) as $j \rightarrow \infty$ then the formula

$$\begin{aligned} & \lim_{p \rightarrow \infty} \sum_{q=1}^{n_p} [\lambda_q^2 - \mu_q^2 - \frac{2}{\pi} \mu_q \int_0^\pi (Q(x)\varphi_{j_q}, \varphi_{j_q}) dx] \\ &= \frac{1}{2} [\text{tr}AQ(0) + \text{tr}AQ(\pi)] + \frac{1}{32} [\text{tr}Q^{(4)}(0) + \text{tr}Q^{(4)}(\pi)] - \frac{1}{\pi} \int_0^\pi \text{tr}AQ(x) dx \end{aligned} \quad (4)$$

is satisfied. Here j_1, j_2, \dots are natural numbers.
