

International scientific conference «Algebraic and geometric methods of analysis»

Book of abstracts

May 31 - June 5, 2017
Odessa
Ukraine

LIST OF TOPICS

- Algebraic methods in geometry
- Differential geometry in the large
- Geometry and topology of differentiable manifolds
- General and algebraic topology
- Dynamical systems and their applications
- Geometric problems in mathematical analysis
- Geometric and topological methods in natural sciences
- History and methodology of teaching in mathematics

ORGANIZERS

- The Ministry of Education and Science of Ukraine
- Odesa National Academy of Food Technologies
- The Institute of Mathematics of the National Academy of Sciences of Ukraine
- Taras Shevchenko National University of Kyiv
- The International Geometry Center

PROGRAM COMMITTEE

Chairman: Prishlyak A. (Kyiv, Ukraine)	Maksymenko S. (Kyiv, Ukraine)	Rahula M. (Tartu, Estonia)
Balan V. (Bucharest, Romania)	Matsumoto K. (Yamagata, Japan)	Sabitov I. (Moscow, Russia)
Banakh T. (Lviv, Ukraine)	Mashkov O. (Kyiv, Ukraine)	Savchenko A. (Kherson, Ukraine)
Fedchenko Yu. (Odesa, Ukraine)	Mykytyuk I. (Lviv, Ukraine)	Sergeeva A. (Odesa, Ukraine)
Fomenko A. (Moscow, Russia)	Milka A. (Kharkiv, Ukraine)	Strikha M. (Kyiv, Ukraine)
Fomenko V. (Taganrog, Russia)	Mikesh J. (Olomouc, Czech Republic)	Shvets V. (Odesa, Ukraine)
Glushkov A. (Odesa, Ukraine)	Mormul P. (Warsaw, Poland)	Shelekhov A. (Tver, Russia)
Haddad M. (Wadi al-Nasara, Syria)	Moskaliuk S. (Wien, Austria)	Shurygin V. (Kazan, Russia)
Herega A. (Odesa, Ukraine)	Panzhenskiy V. (Penza, Russia)	Vlasenko I. (Kyiv, Ukraine)
Khruslov E. (Kharkiv, Ukraine)	Pastur L. (Kharkiv, Ukraine)	Zadorozhnyj V. (Odesa, Ukraine)
Kirichenko V. (Moscow, Russia)	Plachta L. (Krakov, Poland)	Zarichnyi M. (Lviv, Ukraine)
Kirillov V. (Odesa, Ukraine)	Pokas S. (Odesa, Ukraine)	Zelinskiy Y. (Kyiv, Ukraine)
Konovenko N. (Odesa, Ukraine)	Polulyakh E. (Kyiv, Ukraine)	

ADMINISTRATIVE COMMITTEE

- Egorov B., chairman, rector of the ONAFT;
- Povarova N., deputy chairman, Pro-rector for scientific work of the ONAFT;
- Mardar M., Pro-rector for scientific-pedagogical work and international communications of the ONAFT;
- Fedosov S., Director of the International Cooperation Center of the ONAFT;
- Volkov V., Director of the Educational Research Institute of Mechanics, Automation and Computer Systems named after P. M. Platonov;
- Bukaros A., Dean of the Faculty of automation, mechatronics and robotics

ORGANIZING COMMITTEE

Kirillov V.
Konovenko N.
Fedchenko Yu.

Hladysh B.
Nuzhnaya N.

A.O. Prishlyak

(Kyiv, Ukraine)

E-mail: prishlyak@yahoo.com

Let M be a compact smooth connected oriented surface with the boundary ∂M , $f : M \rightarrow \mathbb{R}$ be a smooth function, which has one critical point on each critical level (simple function), $CP(f)$ ($NDCP(f)$) be the set of (non-degenerated) critical points of the function f . We consider the class $\Omega(M)$ of functions f such that the following conditions hold:

- if the critical point p_0 of f belongs to the boundary ∂M , then p_0 is non-degenerated critical point of f ;
- if the critical point p_0 of f is internal ($p_0 \notin \partial M$), then it is non-degenerated critical point of f and $f|_{\partial M}$;
- each critical point p_0 of $f|_{\partial M}$ is also critical point of f .

In other words, $\Omega(M) = \{f : M \rightarrow \mathbb{R} | CP(f) = NDCP(f) = CP(f|_{\partial M}) = NDCP(f|_{\partial M})\}$.

If $p_0 \in CP(f|_{\partial M})$, then $p_0 \in NDCP(f|_{\partial M})$ and $p_0 \in NDCP(f)$.

Let $f \in \Omega(M)$. The components of level lines of function f is called by layer. These layers are homeomorphic to the line segment or to the circle for the regular levels. Then the surface M is divided to the union of the layers which leads to the foliation with the singularities. We call the layer by the layer of the first (the second) type if it corresponds to the component of level line which is homeomorphic to the line segment (circle). Let us consider the equivalence relation on M , such that points are equivalent if and only if they belong to one and the same layer. Finally, the consideration of the quotient topology in the space of these layers advances to some graph Γ_f with black (for the layers of the first type) and red (for the layers of the second type) edges.

Definition 1. A vertex of the graph Γ_f of the function f with the valency 3 (4), incident to three black edges, is called by the *Y-vertex* (*X-vertex*).

We fix the cyclic order of the edges in the *Y* and *X*-vertices of the graph Γ_f accordingly to the orientation of the surface M .

Definition 2. An *equipped Kronrod-Reeb graph* of the function f of the class $\Omega(M)$ is defined to be the graph Γ_f with the following elements:

- black and red edges;
- fixed cycle order in the edges, which are incident to *Y* and *X*-vertices;
- fixed orientation of the edges (upward).

Remind that two given smooth functions $f \in \Omega(M)$ and $g \in \Omega(N)$ are said to be *fiber equipped equivalent* if there exists a homeomorphism $\lambda : M \rightarrow N$, which maps the components of the level sets of f onto the components of the level sets of g and preserve the growing directions of functions.

Definition 3. Equipped Kronrod-Reeb graphs Γ_f and Γ_g of the functions $f, g \in \Omega(M)$ are said to be *equivalent* with the isomorphism $\varphi : \Gamma_f \rightarrow \Gamma_g$ ($\Gamma_f \sim_\varphi \Gamma_g$) if φ satisfies the following conditions:

- preserve the coloration of the edges;
- either preserve the cyclic order in all *Y* and *X*-vertices or simultaneously changes the order in all *Y* and *X*-vertices;
- preserve the orientation of the edges.

Theorem 4. Let M, N be smooth compact surfaces (with the boundaries), $f \in \Omega(M)$, $g \in \Omega(N)$. Then f and g are fiber equipped equivalent if and only if their equipped Kronrod–Reeb graphs Γ_f and Γ_g are equivalent.

Definition 5. A simple deformation of a function $f_1 \in \Omega(M)$ into the function $f_2 \in \Omega(M)$ is defined to be a continuous function $F_t(x) := F(x, t) : M \rightarrow \mathbb{R}$, such that: $F_0(x) = f_1(x)$, $x \in M$ and $F_1(x) = f_2(x)$, $x \in M$. If there exists the one-point subset $I = \{t_0\} \subset (0, 1)$, such that $F_t \in \Omega(M)$, $t \in [0, 1] \setminus \{t_0\}$ and $F_{t_0} \notin \Omega(M)$, then we say that the deformation F_t has the *simple catastrophe* in the point t_0 .

In the case Γ_f is a planar graph its correct to consider the function φ , which puts into the correspondence to each vertex v_i the set of all incident to it edges e_i^v , (for the black edges) l_i^v (for the red ones) and two comparison relations: $v_1 \prec v_2$ ($e_1 \prec e_2$) if v_1 (e_1) is under the v_2 (e_2) and $e_1 \vdash e_2$ if e_1 is left of the edge e_2 . Then the function φ , relations $\prec, \vdash$ and the designation, which the edge is the common to the vertices v_1 and v_2 , clearly define the graph Γ_f .

Definition 6. A simple deformation of Kronrod–Reeb graph is defined to be one of the following operations or converse to it (let v_1, v_2 be adjacent vertices, $v_1 \prec v_2$):

- (1) contraction of the vertex v_2 and the edge $l_1^{v_2}$, if $\varphi(v_1) = \{e_1^{v_1} \prec l_1^{v_1} = l_1^{v_2}\}$, $\varphi(v_2) = \{l_1^{v_2}\}$;
- (2) contraction of the edge $e_1^{v_2} = e_2^{v_1}$ and incident to it vertices v_1, v_2 if $\varphi(v_1) = \{e_1^{v_1} \prec e_2^{v_1} = e_1^{v_2} \vdash e_3^{v_1}\}$, $\varphi(v_2) = \{e_1^{v_2}\}$;
- (3) contraction of the edge $l_1^{v_2} = l_2^{v_1}$ and incident to it vertices v_1, v_2 if $\varphi(v_2) = \{l_1^{v_2}\}$, $\varphi(v_1) = \{l_1^{v_1} \prec l_2^{v_1} = l_1^{v_2} \vdash l_3^{v_1}\}$;
- (4) symmetry of the edge $e_3^{v_1}$ if $\varphi(v_1) = \{e_1^{v_1} \prec e_2^{v_1} = e_1^{v_2} \vdash e_3^{v_1}\}$, $\varphi(v_2) = \{e_1^{v_2} \prec e_2^{v_2} \vdash e_3^{v_2}\}$, ie the isomorphism δ , such that $\varphi(\delta(v_1)) = \{e_1^{\delta(v_1)} \prec e_2^{\delta(v_1)} \vdash e_3^{\delta(v_1)} = e_1^{\delta(v_2)}\}$, $\varphi(\delta(v_2)) = \{e_1^{\delta(v_2)} \prec e_2^{\delta(v_2)} \vdash e_3^{\delta(v_2)}\}$;
- (5) symmetry of the edge $l_3^{v_1}$ if $\varphi(v_1) = \{l_1^{v_1} \prec l_2^{v_1} = l_1^{v_2} \vdash l_3^{v_1}\}$, $\varphi(v_2) = \{l_1^{v_2} \prec l_2^{v_2} \vdash l_3^{v_2}\}$, ie the isomorphism δ , such that $\varphi(\delta(v_1)) = \{l_1^{\delta(v_1)} \prec l_2^{\delta(v_1)} \vdash l_3^{\delta(v_1)} = l_1^{\delta(v_2)}\}$, $\varphi(\delta(v_2)) = \{l_1^{\delta(v_2)} \prec l_2^{\delta(v_2)} \vdash l_3^{\delta(v_2)}\}$;
- (6) when $\varphi(v_1) = \{e_1^{v_1} \prec e_2^{v_1} = e_1^{v_2} \vdash e_3^{v_1}\}$, $\varphi(v_2) = \{e_1^{v_2} \prec e_2^{v_2} \vdash e_3^{v_2}\}$, the raising the vertex v_1 on the edge $e_3^{v_2}$, ie the isomorphism η , such that $\eta(v_2) \prec \eta(v_1)$ and $\varphi(\eta(v_2)) = \{e_1^{\eta(v_2)} \prec e_2^{\eta(v_2)} \vdash e_3^{\eta(v_2)} = e_1^{\eta(v_1)}\}$, $\varphi(\eta(v_1)) = \{e_1^{\eta(v_1)} \prec e_2^{\eta(v_1)} \vdash e_3^{\eta(v_1)}\}$;
- (7) when $\varphi(v_1) = \{e_1^{v_1} \prec l_1^{v_1} = l_1^{v_2}\}$, $\varphi(v_2) = \{l_1^{v_2} \prec l_2^{v_2} \vdash l_3^{v_2}\}$, the isomorphism μ , such that $\mu(v_2) \prec \mu(v_1)$ and $\varphi(\mu(v_2)) = \{e_1^{\mu(v_2)} \prec l_1^{\mu(v_2)} \vdash e_2^{\mu(v_2)} = e_1^{\mu(v_1)}\}$, $\varphi(\mu(v_1)) = \{e_1^{\mu(v_1)} \prec l_1^{\mu(v_1)}\}$;
- (8) when $\varphi(v_1) = \{l_1^{v_1} \prec l_2^{v_1} = l_1^{v_2} \vdash l_3^{v_1}\}$, $\varphi(v_2) = \{l_1^{v_2} \prec e_1^{v_2}\}$, the isomorphism ν , such that $\nu(v_2) \prec \nu(v_1)$ and $\varphi(\nu(v_2)) = \{l_1^{\nu(v_2)} \prec e_1^{\nu(v_2)} = e_1^{\nu(v_1)}\}$, $\varphi(\nu(v_1)) = \{e_1^{\nu(v_1)} \prec l_1^{\nu(v_1)} \vdash e_2^{\nu(v_1)}\}$.

Theorem 7. There exists the simple deformation of codimension 1 between the functions $f, g \in \Omega(M)$ if and only if exists the simple deformation between their Kronrod–Reeb graph Γ_f and Γ_g .
