

International  
Scientific Conference

# Algebraic and Geometric Methods of Analysis

Devoted to 160 anniversary of  
**Dvytro Grave**  
(25.08.1863 - 19.12.1939)  
Academician of the Ukrainian  
Academy of Sciences, the  
first director of the Institute of  
Mathematics of NAS of Ukraine

May 29 – June 1, 2023  
Odesa, Ukraine

## LIST OF TOPICS

- Algebraic methods in geometry
- Differential geometry in the large
- Geometry and topology of differentiable manifolds
- General and algebraic topology
- Dynamical systems and their applications
- Geometric and topological methods in natural sciences
- Geometric problems in mathematical analysis

## ORGANIZERS

- Ministry of Education and Science of Ukraine
- Odesa National University of Technology
- Institute of Mathematics of the National Academy of Sciences of Ukraine
- Taras Shevchenko National University of Kyiv
- Kyiv Mathematical Society

## SCIENTIFIC COMMITTEE

- |  |   |
|--|---|

Moreover, for  $n > 2$  even and for any  $s \in [1, n - 1]$  there exists  $K, C \in \mathcal{K}^n$  such that  $K$  is complete w.r.t.  $C$  with  $s(K) = s$ , such that  $\frac{D(K,C)}{w(K,C)} = \frac{s+1}{2}$ , while for  $n > 2$  odd and any  $s \in [1, n]$  there exists  $K \in \mathcal{K}^n$  which is complete w.r.t.  $C$  with  $s(K) = s$ , such that  $\frac{D(K,C)}{w(K,C)} = \frac{s+1}{2}$ .

## On the possibility of joining two pairs of points in convex domains using paths

Dovhopiatyi Oleksandr  
(Zhytomyr Ivan Franko State University)  
E-mail: Alexdov1111111@gmail.com

Recall,

that a set  $C$  is *convex* if any pair of points  $x, y \in C$  may be joined by some segment which belongs to  $C$ , as well. We define the Euclidean distance between sets and the Euclidean diameter by the formulae

$$d(A, B) = \inf_{x \in A, y \in B} |x - y|, \quad d(A) = \sup_{x, y \in A} |x - y|.$$

Sometimes we also write  $\text{dist}(A, B)$  instead  $d(A, B)$  and  $\text{diam } E$  instead  $d(E)$ , as well. As usually, we set

$$B(x_0, r) = \{x \in \mathbb{R}^n : |x - x_0| < r\}, \\ S(x_0, r) = \{x \in \mathbb{R}^n : |x - x_0| = r\}.$$

We emphasize that, the results established here have already been obtained in particular case, when a domain is the unit ball [1]. Concerning some applications of modulus inequalities in the mapping theory, see [2], cf. [3]–[4].

**Theorem 1.** *Let  $D'$  be a bounded convex domain in  $\mathbb{R}^n$ ,  $n \geq 2$ , and let  $E := B(y_*, \delta_*/2)$  be a ball centered at the point  $y_* \in D'$ , where  $\delta_* := d(y_*, \partial D')$ . Let  $z_0 \in \partial D'$ . Then for any points  $A, B \in B(z_0, \delta_*/8) \cap D'$  there are points  $C, D \in \overline{B(y_*, \delta_*/2)}$ , for which the segments  $[A, C]$  and  $[B, D]$  are such that*

$$\text{dist}([A, C], [B, D]) \geq C_0 \cdot |A - B|, \quad (1)$$

where  $C_0 > 0$  is some constant depending only on  $\delta_*$  and  $d(D')$ .

Recall that, a Borel function  $\rho : \mathbb{R}^n \rightarrow [0, \infty]$  is called *an admissible* for a family  $\Gamma$  of paths  $\gamma$  in  $\mathbb{R}^n$ , if the relation

$$\int_{\gamma} \rho(x) |dx| \geq 1 \quad (2)$$

holds for any locally rectifiable path  $\gamma \in \Gamma$ . A *modulus* of  $\Gamma$  is defined as follows:

$$M(\Gamma) = \inf_{\rho \in \text{adm } \Gamma} \int_{\mathbb{R}^n} \rho^n(x) dm(x). \quad (3)$$

The following statements hold.

**Corollary 2.** *Let, under conditions of Theorem 1,  $\Gamma$  denotes the family of all paths joining the segments  $[A, C]$  and  $[B, D]$  in  $D'$ . Then*

$$M(\Gamma) \leq \frac{m(D')}{C_0^n} \cdot \frac{1}{|A - B|^n}, \quad (4)$$

where  $M$  is the modulus of families of paths defined in (3),  $m(D')$  denotes the Lebesgue measure of  $D'$ , and  $C_0$  is a constant in (1).

**Corollary 3.** *Let, under conditions of Theorem 1,  $\Gamma$  denotes the family of all paths joining the segments  $[A, C]$  and  $[B, D]$  in  $D'$ . Then*

$$M(\Gamma) \geq \tilde{c}_n \cdot \log \left( 1 + \frac{3\delta_*}{8|A - B|} \right), \quad (5)$$

where  $M$  is the modulus of families of paths defined in (3),  $\tilde{c}_n > 0$  is some constant depending only on  $n$  and  $D'$ .

## Backström curves

**Yuriy Drozd**

(Harvard University & Institute of Mathematics of the NAS of Ukraine)

*E-mail:* y.a.drozd@gmail.com

Recall some definitions.

- Definition 1.** (1) A *non-commutative curve* is a pair  $(X, \mathcal{A})$ , where  $X$  is an algebraic curve over a field  $\mathbb{k}$  and  $\mathcal{A}$  is a sheaf of  $\mathcal{O}_X$ -algebras coherent as a sheaf of  $\mathcal{O}_X$ -modules.
- (2) A non-commutative curve  $(X, \mathcal{H})$  is called *hereditary* if for every point  $x \in X$  the localization  $\mathcal{H}_x$  is hereditary (equivalently,  $\text{gl.dim } \mathcal{H} = 1$ ).
- (3) A non-commutative curve  $(X, \mathcal{A})$  is called *Backström* if there is a hereditary non-commutative curve  $(X, \mathcal{H})$  such that  $\mathcal{H} \supset \mathcal{A}$  and  $\text{rad } \mathcal{H}_x = \text{rad } \mathcal{A}_x$  for all points  $x \in X$ .
- (4) The *Auslander envelope* of a Backström non-commutative curve  $(X, \mathcal{A})$  is defined as the non-commutative curve  $(X, \tilde{\mathcal{A}})$ , where  $\tilde{\mathcal{A}} = \text{End}_{\mathcal{A}}(\mathcal{A} \oplus \mathcal{H})$ .

For instance, every (usual) algebraic curve such that all its singularities are simple nodes is a Backström curve, as well as the union of the coordinate axes in the affine space of any dimension.

We study the structure of Backström curves and their Auslander envelopes and prove the following results.
